2193

DATE MAILED: 09/27/2005

Please find below and/or attached an Office communication concerning this application or proceeding.

Office Action Summary

Application No.

09/880,327

Applicant(s)

STEPHENSON, DAVID ARTHUR

Examiner

Todd Ingberg

Art Unit

2193

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 04 April 2005.
- 2a) ☐ This action is **FINAL**. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 2-20 is/are pending in the application.
- 4a) Of the above claim(s) 1 is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 2-20 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☒ The drawing(s) filed on 16 October 2001 is/are: a) ☒ accepted or b) ☐ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some * c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
 2. ☐ Certified copies of the priority documents have been received in Application No. _____.
 3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

DETAILED ACTION

Claim Status

Claim 1 has been canceled

Claim 2 has been amended

Claims 2 – 20 have been examined.

Interpretations

1. The following interpretations are made in view of the Specification.

A. embedding within the software program a user-defined measurement type instance based one of a plurality of **redefined measurement types**; and storing data structures representing the embedded user-defined measurement type instance.

B. the **user-defined measurement type instance includes a measurement type designation and associated variables**

C. data structures representing the embedded user-defined measurement type instance are created and maintained by routines of a library.

D. the predefined measurement types include: **an atomic measurement type**

E. additional data structures representing aggregate measurement type instances based on the embedded user-defined measurement type instance are generated and stored by the library, the **aggregate measurement types accumulated data over a period of time from data states generated for the embedded user-defined measurement type instance.**

F. wherein **aggregate measurement types** include: a count measurement type; a group measurement type; a sum measurement type; and a threshold measurement type.

Claim Rejections - 35 USC § 101

2. 35 U.S.C. 101 reads as follows:

Whoever invents or discovers any new and useful process, machine, manufacture, or composition of matter, or any new and useful improvement thereof, may obtain a patent therefor, subject to the conditions and requirements of this title.

Art Unit: 2193

3. Claims 2 – 20 are rejected under 35 U.S.C. 101 because they are not tangibly embodied on a compute readable medium or presenting functional descriptive material with out steps. The Examiner has provided a way to overcome this rejection.

Claim 2

A method for instrumenting a software pram, the method comprising **the steps of**: embedding within the software program a user-defined measurement type instance based one of a plurality of predefined measurement types, wherein the user-defined measurement type instance includes a measurement type designation and associated variables; and storing data structures representing the embedded user-defined measurement type instance.

Claim 7

A method for collecting data by a library **tangibly embodied on a computer readable medium, comprising the steps of** from a user-defined measurement type instance embedded within a software program, the user-defined measurement type instance having a measurement type selected from among an atomic measurement type, a transaction measurement type, and a polling measurement type, and the library containing one or more additional aggregation measurement types based on the user defined measurement type, the method comprising: receiving data states, comprising current values of variables associated with the embedded user-defined measurement type instance. generated during execution of the software program; filtering the data states; processing data contained in the data states to produce output data according to one or more measurement type instances with which the data states are associated; and packaging output data into reports.

\Claim 13

A software program instrumentation system **tangibly embodied on a computer readable medium** comprising: a library that manages a data structure that represents a software program with an embedded user-defined measurement type instance having a measurement type selected from among predefined measurement types and associated with variables. the library managing data structures that represent the embedded user-defined measurement type, the embedded user-defined measurement type instance, and one or more additional aggregate measurement types based on the embedded user-defined measurement type instance, the library collecting data states generated from current values of the variables associated with the embedded user-defined measurement type instance and generating reports based on the collected data states; and a data analysis routine that configures the data structures by altering values of fields within the data structures to control data collection and reporting by the library, and that receives the generated reports from the library.

Claim Rejections - 35 USC § 102

4. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(e) the invention was described in a patent granted on an application for patent by another filed in the United States before the invention thereof by the applicant for patent, or on an international application by another who has fulfilled the requirements of paragraphs (1), (2), and (4) of section 371(c) of this title before the invention thereof by the applicant for patent.

The changes made to 35 U.S.C. 102(e) by the American Inventors Protection Act of 1999 (AIPA) and the Intellectual Property and High Technology Technical Amendments Act of 2002 do not apply when the reference is a U.S. patent resulting directly or indirectly from an international application filed before November 29, 2000. Therefore, the prior art date of the reference is determined under 35 U.S.C. 102(e) prior to the amendment by the AIPA (pre-AIPA 35 U.S.C. 102(e)).

5. Claim 2 is rejected under 35 U.S.C. 102(e) as being anticipated by USPN # 6,079,032 Peri filed May 19, 1998 and published June 20, 2000.

Claim 2

A method for instrumenting a software program, the method comprising: embedding within the software program a user-defined measurement type instance based on one of a plurality of predefined measurement types, wherein the user-defined measurement type instance includes a measurement type designation and associated variables; and storing data structures representing the embedded user-defined measurement type instance.

Examiner's Response

Peri anticipates a method for analyzing performance of a software measurement type instance in the software (Abstract, lines 3 – 5) whereby the predefined measurements are of the types of run-time metrics (Abstract, lines 5-6). Peri further teaches the run-time metrics measurement types associated with other variables such as range break points (Abstract, lines 6-8). Finally Peri provides storing the embedded user defined measurement type instance (Col 3, lines 41 – 60, also see figure 2 item # 206).

Allowable Subject Matter

6. Claims 3 – 6 are objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.

7. Claims 7 – 20 are allowed.

8. The remaining claims are presented below:

Claim 3

The method of claim 2 wherein the user-defined measurement type instance is associated with a data state comprising the current values of the associated variables, and wherein the data structures representing the embedded user-defined measurement type instance are created and maintained by routines of a library.

Claim 4

The method of claim 3 wherein the predefined measurement types include: an atomic measurement type, a data set for which can be transmitted to the library at points in time selected by the software program; a transaction measurement type, data collection for which can be started and ended by the software program, and, upon ending, results in transmission of a data set to the library; and a polling measurement type, data sets for which are obtained by the library from the software program at regular intervals.

Claim 5

The method of claim 3 wherein the additional data structures representing aggregate measurement type instances based on the embedded user-defined measurement type instance are generated and stored by the library, the aggregate measurement types accumulated data over a period of time from data states generated for the embedded user-defined measurement type instance.

Claim 6

The method of claim 5 wherein aggregate measurement types include: a count measurement type; a group measurement type; a sum measurement type; and a threshold measurement type.

Claim 7

A method for collecting data by a library from a user-defined measurement type instance embedded within a software program, the user-defined measurement type instance having a measurement type selected from among an atomic measurement type, a transaction measurement type, and a polling measurement type, and the library containing one or more additional aggregation measurement types based on the user defined measurement type, the method comprising: receiving data states, comprising current values of variables associated with

Art Unit: 2193

the embedded user-defined measurement type instance. generated during execution of the software program; filtering the data states; processing data contained in the data states to produce output data according to one or more measurement type instances with which the data states are associated; and packaging output data into reports.

Claim 8

The method of claim 7 wherein filtering of a data state further includes applying a filter expression to the variable values contained in the data state to determine whether or not to accept the data state for further processing.

Claim 9

The method of claim 8 wherein a filter expression may be associated with each measurement type instance.

Claim 10

The method of claim 7 wherein processing data contained in a data state to produce output data further includes: selecting each measurement type instance associated with the data state; for each selected measurement type if the measurement type, is derived from the atomic or polling measurement type, including the variable values in the data state in the output data, if the measurement type is derived from the transaction data type, including the variable values in the in the data state in the output data along with a calculated value equal to a transaction duration; and if the measurement type is an aggregate measurement type; accumulating data for subsequent data output.

Claim 11

The method of claim 7 further including transmitting the reports to a data analysis component.

Claim 12

The method of claim 7 further including transmitting a description of the embedded user-defined measurement type instance and any aggregate measurement type instances based on the embedded user-defined measurement type instance to a data analysis component. which then transmits configuration information back to the library to control collection and reporting of output data.

Claim 13

A software program instrumentation system comprising: a library that manages a data structure that represents a software program with an embedded user-defined measurement type instance having a measurement type selected from among predefined measurement types and associated with variables. the library managing data structures that represent the embedded user-defined measurement type, the embedded user-defined measurement type instance, and one or more additional aggregate measurement types based on the embedded user-defined measurement type instance, the library collecting data states generated from current values of the variables associated with the embedded user-defined measurement type instance and generating reports based on the collected data states; and a data analysis routine that configures the data structures

Art Unit: 2193

by altering values of fields within the data structures to control data collection and reporting by the library, and that receives the generated reports from the library.

Claim 14

The software program instrumentation system of claim 13 wherein the predefined measurement types include: an atomic measurement type, a data set for which can be transmitted to the library at points in time selected by the software program; a transaction measurement type, data collection for which can be started and ended by the software program, and, upon ending, results in transmission of a data set to the library; and a polling measurement type, data sets for which are obtained by the library from the software program at regular intervals.

Claim 15

The software program instrumentation system of claim 13 wherein the one or more additional aggregate measurement types are derived from predefined aggregate measurement types including: a count measurement type that accumulates, over a data collection interval, a count of data states associated with the embedded user-defined measurement type instance; a group measurement type that accumulates, over a data collection interval, a count of data states associated with the embedded user-defined measurement type instance and some number of additional embedded user-defined measurement type instances; a sum measurement type that accumulates, over a data collection interval, statistical quantities derived from a variable value within the data states; and a threshold measurement type that accumulates, over a data collection interval, a count of data states associated with the embedded user-defined measurement type instance that contain variable values that produce an acceptance output from a threshold test expression.

Claim 16

The software program instrumentation system of claim 15 wherein the sum measurement type accumulates components of statistical quantities, including median, average, and standard deviation, so the running medians, averages, and standard deviations may be computed over time from multiple reports.

Claim 17

The software program instrumentation system of claim 13 wherein the library collects data states generated from current values of the variables associated with the embedded user-defined measurement type instance by: filtering the data states based on filtering criteria associated with each measurement type instance in order to direct a data state to each measurement type instance with which it is associated providing that the data state is accepted for the measurement type instance by the filtering criteria; for an accepted data state directed to a transaction measurement type instance, calculating a duration value for the transaction and including that duration value in the data state; for an accepted data state directed to an aggregation measurement type instance, processing the data state according to the aggregation measurement type of the aggregation measurement type instance; and outputting the data state for the user-defined measurement type instance, when the user-defined measurement type instance is configured for

Art Unit: 2193

output, into a report; and outputting accumulated data for aggregation measurement type instances at a next accumulation interval into a report.

Claim 18

The software program instrumentation system of claim 13 wherein an aggregate measurement type instance may include key variables that control partitioning of accumulated data into a set of accumulated data, each accumulated data of the set output into a report at a next accumulation interval by the library.

Claim 19

The software program instrumentation system of claim 18 wherein only the highest values within a set of accumulated data are output into a report at a next accumulation interval by the library.

Claim 20

The software program instrumentation system of claim 13 wherein the reports are XML: documents.
